- ~~17~~ 16.(New) A process for controlling fruit-specific gene expression in a non-climacteric plant comprising:  
a) isolating mRNA from ripening blackcurrant fruit;  
b) preparing a cDNA library from the isolated mRNA;  
c) differentially screening the library from b) to identify genes expressed during the ripening period;  
d) screening a genomic library with probes prepared from cDNA identified according to step c) to isolate the corresponding gene and its fruit-specific promoter region;  
e) transforming a plant cell from a non-climacteric plant with a DNA sequence comprising the promoter region isolated in step d); and  
f) regenerating a whole plant from the transformed plant cell.
